

# IETF HTTP WG 2022-02 Interim - QUERY Method

[Julian Reschke](#), greenbytes

## Current Status

Latest changes:

- We have picked QUERY as method name (instead of the initial proposal to use SEARCH).
- Cacheability is defined as similar to GET, except that the request content (payload) needs to be considered in addition to URI.

## Open Questions

- Can we assign a GETtable URI to the query result? Maybe Content-Location? ([#1745](#)).
- Examples: would be good to have something with a well-defined query language (incl. media type), and matching response format. ([#1906](#))
- How do conditionals interact with QUERY? ([#1917](#))
